IDEATION & BRAINSTORMING REPORT

Consolidation Discussion

The general user has a mistrust of voice interfaces. This poses a major hurdle in normalizing the use of STARFare technology and its voice command technology. Through repeated testing and interviews, users trust in voice technology can be built.

Final Ideas

STARFare voice command technology can be very useful in emergency situations where ship members are injured or for other reasons unable to reach a console. With voice authorization, STARFare crew members can still interact and use the ships computer and command systems without any need to interact with the console display physically.

Building off of this, STARFare voice command technology could greatly benefit disabled users, such as those suffering from blindness. This group of users has a reduced mistrust in voice as they are already using similar technology in other areas of their daily lives. By incorporating it into the ship's technology, these users can easily simplify another area of their lives. This would allow even more valuable members to join STARFare and bring their knowledge with us on our journeys throughout the universe.
